

December 2016

On 30 November 2016 an interactive workshop was held at Grantville Hall so that the community members of Pioneer Bay could review the information collected from the previous workshop and continue to develop the design.

Melbourne Water also attended the workshop to discuss the implementation of the Pioneer Bay Drainage Strategy. Council officers have been working in partnership with Melbourne Water to develop the Strategy. This Strategy looks at solutions to resolve the current drainage issues within the creek to the north of the estate through an integrated stormwater management approach, as well as improving the quality of the stormwater runoff.

The workshop focused on aspects of the design related to traffic calming devices and the locations of these devices, and footpath locations.

During the last workshop in April 2016, residents were asked to place dots on their most preferred traffic devices and point out where the devices should be located within the estate. The community was also asked to map out their traffic movements throughout the estate. Using this

information we developed four traffic options. The community members were asked to review these four options and place a green dot on their most preferred traffic option, a yellow dot on their second preference and a red dot on their least preferred option. A copy of the traffic options from the workshop are shown below

court-bowl treatment

We then asked the community members to map out their walking path through the estate. Using this information we developed four footpath options. The community members were asked to review these four options and place a green dot on their most preferred layout, a yellow dot on their second preference and a red dot on their least preferred layout.

Each person was then asked to place blue dots on the side of the street they would most prefer that path to be placed.
